

METHODS AND DEVICES FOR DELIVERY OF AGENTS TO BREAST MILK DUCTS

ABSTRACT OF THE DISCLOSURE

The invention provides devices, kits and methods for delivering an agent to a
5 breast milk duct. Intraductal agent delivery provides an opportunity to treat a breast
condition locally and avoid the pitfalls of systemic drug delivery for a local condition. Time-
released agents delivered into the ducts using an intraductal device or formulation reduces the
frequency of intraductal administration required for desired efficacy over time. The methods
include methods of treating a breast condition, including the conditions of cancer or
10 precancer.
